## Introduction

Since its inception in 1988, the Texas School Survey of Drug and Alcohol Use (TSS) has been a biannual collaborative effort between the Texas Department of State Health Services (DSHS) and the Public Policy Research Institute (PPRI) at Texas A&M University to collect and analyze information on substance use among Texas youth. The TSS project has two primary objectives. First, it serves to inform state and local policy-makers about the extent and nature of substance use among secondary students in Texas public schools. Second, the statewide survey provides a standard of comparison for districts conducting local assessments of drug and alcohol use.

The purpose of this document is to provide a standardized codebook for use with the 1998 to 2014 TSS secondary datasets (grades 7 through 12). Following a brief introduction to the survey instrument, attention is focused on sample selection and survey administration procedures. Next, methods for data processing and quality control are described. The document concludes with a detailed breakdown of all TSS questions asked from 1998 to 2014.

## Survey Sample

The Texas Commission on Alcohol and Drug Abuse (now the Texas Department of State Health Services) funded the first administration of the Texas School Survey in the spring of 1988. Over the years, the sample design has evolved, but the goal has remained the same: to achieve representative state results. Although every Texas school district has the opportunity to participate in the survey every year, only a small percentage are randomly selected to participate in the state administration during the spring semester of even numbered years. During these years, students are randomly selected to participate from Texas school districts using a multi-stage probability design. From 1988 to 2012, school districts served as the primary sampling unit; classrooms were then randomly selected across sampled districts. Beginning in 2014, the individual school became the primary sampling unit in an effort to decrease the burden of survey administration on districts and subsequently increase participation rates. Results for the statewide survey include data from the school districts that were randomly selected in the statewide sample. Data from school districts requesting local survey administration are not included in the project's overtime database.

## Survey Instrument

Historically, two versions of the TSS were developed and administered. The more comprehensive questionnaire was designed for students in grades seven through twelve<sup>1</sup> and a simplified version was created for students in grades four through six. Beginning in 2014, the more comprehensive (secondary) version was administered to students in grades 6 through 12 and grades 4 and 5 were eliminated from the sample. Therefore, this codebook will focus on the data collected from the secondary form.

The survey measures students' use of, exposure to, and attitudes regarding tobacco (cigarettes, snuff, and chewing tobacco), alcohol (beer, wine, wine coolers, and liquor), inhalants, prescription drugs, marijuana, and

---

<sup>1</sup> The 2014 survey was designed for students in grades six through twelve.

other illicit drugs (powdered cocaine, crack, hallucinogens, uppers, downers, steroids, ecstasy, Rohypnol, methamphetamine, and heroin). Other sets of questions were designed to assess behavioral correlates of substance use and students' perceptions of support available to help them cope with substance-related problems.

The survey instrument has received slight revisions throughout the years for purposes of keeping up-to-date on drugs and other relevant topics to measure alcohol and drug use trends among youth. However, major revisions rarely occur and typically result from the need to reduce survey administration time in schools. The last major revision occurred in 1998 where similar questions assessing substance use prevalence rates were grouped together in a matrix format to reduce survey administration time. Again, in 2013, PPRI and DSHS revised the TSS secondary survey instrument with the purpose of increasing the accuracy of responses, preventing respondent fatigue, and to include responses from students in grade 6; thus eliminating the elementary survey instrument. The decision to migrate to one form was made based on increased concerns from parents and school districts about surveying young students in 4th and 5th grade as well as the need to streamline administration procedures for schools. Therefore, in 2014, the survey involved only students in grades 6 through 12 using one survey form.

Since 1988, PPRI has administered a paper-pencil version of the TSS. Beginning in 2012, school districts have had the option of using a web-based version of the survey in addition to the traditional paper-pencil version. The web survey is programmed in LimeSurvey, a widely used software application for internet surveys, and hosted on a secure server at Texas A&M University. The paper-pencil questionnaire is in a format that can be scanned optically, similar to that used for standardized testing. Both versions are designed for anonymous self-administration by students with the aid of a staff member to pass out the survey or web survey tokens, read a common set of instructions, monitor the class during survey administration, and collect the instruments or web survey tokens after the survey is completed.

## **Survey Administration Procedures**

A standardized set of survey administration procedures was developed by PPRI in collaboration with DSHS. Districts are asked to strictly adhere to the prescribed procedures so that survey administration is uniform throughout the state. All survey administration procedures have been approved by the Texas A&M Institutional Review Board. Prior to receiving survey materials, an Information Sheet regarding the survey was provided for required dissemination to parents/guardians a minimum of two weeks prior to survey administration. The Information Sheet explained the voluntary nature of the survey and that students may choose to opt out of participation at any time. It also provided a mechanism for parents to let the school know if they did not want their child to participate. This form emphasized that participation is completely anonymous.

Survey administration took place in the classroom during regularly scheduled class periods. Teachers in selected classrooms were given a script to read so that all students would receive a standardized set of instructions prior to completing the survey. The scripts were provided to the campuses at least a week before survey administration in order to allow teachers sufficient time to familiarize themselves with the survey procedures.

Students were instructed to place the questionnaire in a large manila envelope once the survey was completed. The envelopes containing the survey instruments from all participating classrooms were collected and returned to PPRI for processing at the end of data collection. Students who were absent on the day the survey was administered were not allowed to make-up the survey on a later day.

Survey administration for the web version followed the standard Texas School Survey procedures with slight modifications due to the variation in mode. Students completed the web survey either in their regular classroom using portable laptop computers, or by taking the survey in the school computer lab. Instead of receiving paper copies of the survey instrument, students in sampled classrooms were provided with unique, randomly generated six digit alpha-numeric codes, referred to as survey tokens. These survey tokens could only be used once and provided access to the online survey via a secure website. To ensure only sampled classrooms completed the online survey, all unused and used survey tokens were collected by the survey administrator when surveys were completed. Additionally, PPRI limited access to the online survey during the district's scheduled survey administration period.

## Data Processing

### *Exaggerated Responses*

Because the TSS data is based entirely upon respondents' description of their own behavior, it is inevitable that some students will under- or over-report their use of drugs or alcohol, and to the extent possible, PPRI attempted to identify and eliminate data from those respondents. Two checks were incorporated into the data analysis program to identify exaggerators. First, both elementary and secondary students were asked about their use of a false drug. Depending on the year of the survey, this drug was called "Cosma" (1998-2002), "Shimeron" (2004-2006), "Oxaril" (2008-2010), and "Damaxil" (2012-2014). Data from students claiming to have used this substance were considered suspect and dropped from the dataset. To avoid confusion, these variables have been removed from the datasets across all years.

Second, checks were run to identify any students claiming extremely high levels of drug and alcohol use. Secondary students were defined as exaggerators if they met one or more of the following criteria: (1) students reported that they had five or more drinks of two or more alcoholic beverages every day; (2) students reported that they had consumed three or more alcoholic beverages every day; or (3) students reported that they used four or more drugs (other than cigarettes, alcohol, or steroids) eleven or more times in the past month. As in those cases where students reported using the fake drug, data from students reporting exaggerated use were also dropped from the analyses.

### *Surveys from "Out-of-Range" Grades*

Occasionally, students from a grade that is not technically being surveyed are included in the district sample. This is primarily a problem where the survey is administered in a non-contiguous grade combination (e.g., 8, 10, and 12). In these instances, the final sample often contains a few students who are in "out of range" grade levels. Generally, data for these students is not thrown out. Rather, it is re-coded and included with the next contiguous grade level. A conservative approach is used whereby younger students can be grouped with their

older peers, but older students cannot be recoded to a lower grade. This prevents artificially high levels of reported substance use in lower grades.

There are two cases in which the "out-of-range" data is dropped from the analyses rather than being re-coded: (1) if there is no contiguous higher grade with which to combine the data; and (2) if the number of respondents in "out-of-range" students is greater than ten percent of the grade with which they are being grouped. This latter measure is designed to prevent a large number of "out of range" grades from obscuring the true grade-level values.

### *Unreported Grade Levels*

When students failed to report their grade level, it was impossible to determine unequivocally in which grade these students' data should be analyzed. When a grade level was missing, an estimate of the grade was made based on the students' age and the data were retained. Table 1 identifies the range of students' ages and the corresponding grade levels that were assigned. If both grade and age were missing, the data were dropped from the dataset.

**TABLE 1. Age-Based Grade Assignments.**

<b>Age</b>	<b>Secondary Level</b>
11	6th Grade
12	7th Grade
13	8th Grade
14	9th Grade
15	10th Grade
16	11th Grade
17 or older	12th Grade

## Weighting

In many districts, the percentage of all enrolled students that actually take the survey varies substantially by grade. Though patterns are different for each district, typically a larger proportion of younger students complete the survey compared to their older peers. If a simple average is taken when calculating overall levels of use, older students may not be represented in proportion to their numbers. Since these are the very students most likely to use drugs or alcohol, their underrepresentation in the aggregate scores results in artificially lower overall levels of substance use. To achieve more representative percentages when calculating overall or aggregate levels of substance use, a "weighted average" procedure was used. Prior to calculating the averages, scores for each grade surveyed were weighted by the total enrollment for that grade. By weighting averages by actual enrollment, over- or under-sampling in aggregate scores is partially alleviated.

Weights were applied to each case based on the strata, district, and campus. The weights were applied so that the aggregation of students in each campus, district, and strata reflected their proportions in the actual district, campus, and strata populations. The formulae used to determine these weights are presented below:

2014

- The weights for the Texas School Survey of Drug and Alcohol Use are calculated in the following manner: State Sample
  - Campus Weight
    - Probability of each school being sampled
      - $A = \text{Total number of "adjusted" students in school (over/under-sampled)}^2$
      - $B = \text{total "adjusted" population in region}$
      - $D = \text{total number of schools sampled}$
      - School's probability  $X = (A \times D) / B$
    - Raw weight
      - $H = 1/X$
  - Sample weight adjustment
    - $A = \text{Total number of "adjusted" students in school (over/under-sampled)}$
    - $J = \text{Total number of actual students in school}$
    - Adjustment  $K = J/A$
  - Preliminary Weight
    - Preliminary Weight  $P = K \times H$
  - Population Weight Adjustment
    - $L = \text{Total population (In Region)}$
    - $Q = \text{Total population (In Region) after applying Weight (P) for participating schools}$
    - Population Weight Adjustment  $R = Q/L$
  - Campus Weight
    - Campus Weight  $Z = P/R$

---

<sup>2</sup> "(over/under-sampled)" refers to the increased probability attached to students in certain schools such as border schools and junior high campuses as discussed in the "Selection of Campuses" section of the report.

- Student Weight
  - Probability of each Student sampled in school
    - $G$ =Number of students in grade
    - $C$ = Number of students sampled in grade
    - Student Weight  $Y=G/C$
  - Weight
    - Weight  $W=Y*Z$
- Post Hoc Weights
  - Adjustment for grade distribution
    - $U$ = State population in grade
    - $V$ = State sample/grade population after applying weight  $W$
    - Grade Weight Adjustment  $GW=W*(U/V)$
  - Adjustment for race/ethnicity
    - $S$ =Region Race/ethnicity population
    - $T$ = Region Race/ethnicity population after applying weight  $GW$
    - Final Weight  $rweight=GW*(S/T)$

2000 — 2012

### District Level Weights

Within the selected districts, students were sampled via a simple random sample of classrooms (i.e., a sample in which all classrooms in the district had an equal chance of selection) picked directly from the district. All students in the sampled classrooms were asked to participate in the survey.

A weight  $w_{ilk}$  is assigned to each sampled classroom  $k$ , in grade  $l$ , in district  $i$ :

$$w_{ilk} = \frac{N_{il}}{n_{il}} \quad (1)$$

where,

$N_{il}$  = total no. of classrooms in grade  $l$ , in district  $i$

$n_{il}$  = no. of classrooms sampled in grade  $l$ , in district  $i$

Since every student in the sampled classrooms was included in the sample, each student's probability of selection is equal to his/her classroom's probability of selection. Thus, each sampled student in these districts is assigned his/her classroom weight. Therefore the weight  $w_{ilr}$  of the  $r^{\text{th}}$  sampled student in classroom  $k$  is,

$$w_{ilr} = w_{ilk} \quad (2)$$

Remark: In (1), if the true  $N_{il}$  is not known for a particular district, estimate it with,

$$\hat{N}_{il} = \frac{M_{il}}{\hat{c}_{il}} \quad (3)$$

where,  $\hat{c}_{il} = m_{il} / n_{il}$  and

$M_{il}$  = total no. of students in grade  $l$ , in district  $i$

$m_{il}$  = no. of students sampled in grade  $l$ , in district  $i$

Notice that in this case, the weights in (1) reduce to,  $w_{ilk} = M_{il} / m_{il}$ .

### District Level Estimates

The total no. of students in grade  $l$ , in district  $i$ , giving a positive response to a question is estimated as

$$\hat{Y}_{il} = \sum_{r=1}^{m_{il}} w_{ilr} y_{ilr} \quad (4)$$

where

$$y_{ilr} = \begin{cases} 1 & \text{if the } r^{\text{th}} \text{ student's response is positive} \\ 0 & \text{otherwise} \end{cases}$$

and  $w_{ilr}$  is as defined in (2).

The proportion of students in grade  $l$ , in district  $i$ , giving a positive response to a question is estimated as,

$$\hat{Y}_{il} = \frac{\hat{Y}_{il}}{M_{il}}$$

### Stratum Level Weights

The districts were selected from strata that were formed on the basis of two factors, namely, how urban the districts were and the levels of enrollment. That is, once the districts were grouped by the degree to which they were urban, strata were formed by collecting together districts of similar size within these urban classes. Next, a simple random sample of districts was chosen from each stratum. A few large districts were selected to the sample with probability one. These districts were grouped into two strata based on the relative sizes of the districts.

Stratum level weights are assigned to the sampled students as follows. The weight  $w_{hirl}^s$  of the  $r^{\text{th}}$  sampled student, from grade  $l$ , in district  $i$  in stratum  $h$  is,

$$w_{hirl}^s = \frac{1}{p_{hi}} w_{ilr} \quad (5)$$

where

$$p_{hi} = \begin{cases} 1 & \text{if district } i \text{ was sampled with probability 1} \\ \phi_{hi} & \text{otherwise} \end{cases} \quad (6)$$

and within grade  $l$ , for each district  $i$  in stratum  $h$ ,  $w_{ilr}$  is as defined in (4), and  $\phi_{hi} = n_h / N_h$  with

$n_h$  = no. of districts sampled from stratum  $h$

$N_h$  = total number of districts in stratum  $h$

Notice that within stratum  $h$ ,  $\phi_{hi}$  does not depend on district  $i$ .

### State Level Estimates

The total no. of students in grade  $l$ , giving a positive response to a question is estimated as

$$\hat{Y}_l = \sum_{h=1}^H \hat{Y}_{hl} \quad (7)$$

with

$$\hat{Y}_{hl} = \sum_{i=1}^{n_h} \sum_{r=1}^{m_{il}} w_{hiltr}^s y_{iltr} \quad (8)$$

where, within grade  $l$ , for each district  $i$  in stratum  $h$ ,  $y_{iltr}$ , and  $m_{il}$  are as defined above.

The proportion of students in grade  $l$ , in the state, giving a positive response to a question is estimated as,

$$\hat{\bar{Y}}_l = \frac{1}{M_l} \sum_{h=1}^H \hat{Y}_{hl} \quad (9)$$

where,

$M_l$  = total number of students in grade  $l$  in state.

1998

### District Level Weights

Within the selected districts, students are sampled using two different methods:

- i) a SRS sample of classrooms are picked directly from the district
- ii) a SRS sample of students are picked directly from the district

Weighting is specified separately for the two types of selection.

#### i) Districts in which classrooms are sampled

A weight  $w_{ilk}$  is assigned to each sampled classroom  $k$  in the sample, in grade  $l$ , in district  $i$ :

$$w_{ilk} = \frac{N_{il}}{n_{il}} \quad (1)$$

where,

$N_{il}$  = total no. of classrooms in grade  $l$ , in district  $i$

$n_{il}$  = no. of classrooms sampled in grade  $l$ , in district  $i$

Since every student in the sampled classrooms is included in the sample, each student's probability of selection is equal to his/her classroom's probability of selection. Thus, each sampled student in these districts is assigned his/her classroom weight. Therefore the weight  $w_{iltr}$  of the  $r^{\text{th}}$  sampled student in classroom  $k$  is,

$$w_{iltr} = w_{ilk} \quad (2)$$

**Remark:** In i), if the true  $N_{il}$  is not known for a particular district, estimate it with,

$$\hat{N}_{il} = \frac{M_{il}}{\hat{c}_{il}} \quad (3)$$

where,  $\hat{c}_{il} = m_{il} / n_{il}$ . Notice that in this case, the weights in (1) reduce to,  $w_{ilk} = M_{il} / m_{il}$ .

## ii) Districts in which students are sampled

A weight  $w_{ilr}$  is assigned to each student in the sample, in grade  $l$ , in district  $i$ .

$$w_{ilr} = \frac{M_{il}}{m_{il}} \quad (4)$$

where,

$M_{il}$  = total no. of students in grade  $l$ , in district  $i$

$m_{il}$  = no. of students sampled in grade  $l$ , in district  $i$

## District Level Estimates

The total no. of students in grade  $l$ , in district  $i$ , giving a positive response to a question is estimated as

$$\hat{Y}_{il} = \sum_{r=1}^{m_{il}} w_{ilr} y_{ilr} \quad (5)$$

where

$$y_{ilr} = \begin{cases} 1 & \text{if the } r^{\text{th}} \text{ student's response is positive} \\ 0 & \text{otherwise} \end{cases}$$

and  $w_{ilr}$  is as defined in (2) and (4) depending on if classrooms or students are sampled in the district.

The proportion of students in grade  $l$ , in district  $i$ , giving a positive response to a question is estimated as,

$$\hat{Y}_{il} = \frac{\hat{Y}_{il}}{M_{il}}$$

## Stratum Level Weights

The districts were selected from strata that were formed on the basis of how urban the districts were. Within each stratum, districts were sampled with probability proportional to size. A few large districts were selected to the sample with probability one. These districts were grouped into two strata based on the relative size of the districts.

Stratum level weights are assigned to the sampled students as follows. The weight  $w_{hitr}^s$  of the  $r^{\text{th}}$  sampled student, from grade  $l$ , in district  $i$  in stratum  $h$  is,

$$w_{hitr}^s = \frac{1}{p_{hi}} w_{ilr} \quad (6)$$

where

$$p_{hi} = \begin{cases} 1 & \text{if district } i \text{ was sampled with probability 1} \\ \phi_{hi} & \text{otherwise} \end{cases} \quad (7)$$

and within grade  $l$ , for each district  $i$  in stratum  $h$ ,  $w_{ilr}$  is as defined in (5), and  $\phi_{hl} = n_h M_{hl} / M_h$  with

$n_h$  = no. of districts sampled from stratum  $h$

$M_{hi}$  = total enrollment (all grades) in district  $i$  in stratum  $h$

$M_h$  = total enrollment (all grades) in stratum  $h$

### State Level Estimates

The total no. of students in grade  $l$ , giving a positive response to a question is estimated as

$$\hat{Y}_l = \sum_{h=1}^H \hat{Y}_{hl} \quad (8)$$

with

$$\hat{Y}_{hl} = \sum_{i=1}^{n_h} \sum_{r=1}^{m_{il}} w_{hilr}^s y_{ilr} \quad (9)$$

where, within grade  $l$ , for each district  $i$  in stratum  $h$ ,  $y_{ilr}$ , and  $m_{il}$  are as defined above.

The proportion of students in grade  $l$ , in the state, giving a positive response to a question is estimated as,

$$\hat{\bar{Y}}_l = \frac{1}{M_l} \sum_{h=1}^H \hat{Y}_{hl} \quad (10)$$

## Limitations of the Data

A number of subtle factors, such as sampling error and the limitations of self-reported data, can have a major bearing on the meaning and/or conclusions of the data. In addition, an awareness of the precise population to which findings can be generalized is also valuable because knowing who was not included in the survey can be as important as knowing who was included. In the following paragraphs, some of the most significant caveats relating to both the statewide and regional findings are discussed.

### *Survey Population*

In generalizing the results of the state and regional surveys, it should be remembered that the data were collected in public schools. Neither private school students nor drop-outs were sampled, though both represent significant components of the youth population of Texas. These limitations should be kept in mind when considering the implications of the data. The findings do, however, represent reasonable estimates of drug use among the public school population of Texas and offer a suitable basis of comparison for public school districts.

### *Self-Reported Data*

The drug and alcohol use data are entirely based on self-reported information. While a number of studies have established the usefulness of self-reported information for estimating the incidence and prevalence of drug use, the validity of these data ultimately depends on the truthfulness, recall, and comprehension of respondents. This study is carefully designed to minimize the impact of these potential sources of error. For example, students who report impossibly high levels of substance use or use of non-existent drugs are eliminated from analysis. Further, differences in recall or comprehension are assumed to be constant across both the state and regional survey samples. Any reporting bias in the data should therefore be approximately equal in both assessments, and comparisons between regional and state data should be valid. Nonetheless, the limitations of self-reported information should be considered when drawing conclusions about the data.

### *Sampling Error*

The statewide survey data is based on a sample of Texas public school students. Because a sample rather than the entire population of students was surveyed, a certain amount of error is introduced when generalizing findings from the sample to the population. To gauge the size of this error, confidence intervals for all estimates are ascertained. In general, however, small differences of a few percentage points are usually not statistically meaningful. Attention should be focused on large differences of five percentage points or more.

## Codebook

The codebook documents the SAS, Stata, SPSS, and Excel datasets that are available for public use. The columns in the codebook include the following information:

<b>Question Number</b>	This column contains the question number, as listed on the survey instrument. There were several year-to-year variations in question numbers for a given question. In these instances, the appropriate question number is listed under the heading for the corresponding year(s).
<b>Variable Name</b>	This column contains the variable names. Variables are listed in the codebook as they appear in their respective datasets. There will be instances in which a dataset will not contain the variable listed; this is due to the multi-year nature of the codebook. The year(s) listed above the variable name indicate the year of the corresponding dataset.
<b>Question Wording</b>	This column contains the question, as it was worded on the survey instrument. There will be instances in which there were year-to-year question wording changes. When this occurs, the appropriate question wording is listed under the heading for the corresponding year(s).
<b>Response Options</b>	This column contains the response options for a question. There will be instances in which there were year-to-year response option changes. When this occurs, the appropriate response options are placed under the heading for the corresponding year(s).
<b>Response Values</b>	This column contains the response values for each response option. There will be instances in which there were year-to-year differences in response values. When this occurs, the appropriate response values are placed under the heading for the corresponding year(s).
<b>Response Type</b>	This column contains the response type for the response options.
<b>Weighted Frequency</b>	This column contains the number of respondents who chose a given response option. These frequencies, with the exception of “Missing” responses, are weighted to represent students in the State of Texas.
<b>Weighted Percent</b>	This column contains the percentage of respondents who chose a given response option. These percentages are weighted to represent students in the State of Texas.

**\*\*Note: If datasets are appended, variations in question wording and/or labels should be addressed.**
